## Regarding Response to Typhoon "Ragasa"

To ensure your safety, the Management Studio hereby issues the following key response measures for Typhoon "Ragasa". Please take them seriously and prepare in advance:

### I. Monitor Early Warnings

Stay updated on the typhoon's path, warning levels, and affected areas through official channels. Pay close attention to short-term imminent warnings and heavy rain alerts, and strictly adhere to the "call-and-response" mechanism for disaster warnings.

As of 19:00 on September 22, 2025:

A Typhoon Yellow Warning Signal has been pre-issued. Typhoon "Ragasa" (Super Typhoon level), the 18th typhoon this year, is expected to move towards the central and western coast of Guangdong. It is forecasted that wind and rain in our city will gradually intensify from the afternoon of the 23rd. The period from the night of the 23rd to the 24th will experience the strongest wind and rain, posing an extremely high risk of disasters. The Shenzhen Meteorological Observatory will upgrade the Typhoon Blue Warning Signal to Yellow for the entire city around 21:00 on September 22, 2025. Please pay attention and take precautions against the typhoon and heavy rainfall. It is expected that wind and rain in our city (including Shenshan) will gradually increase from the afternoon of the 23rd. The strongest wind and rain are anticipated from the night of the 23rd to the 24th. On the 24th, the maximum gusts are forecast to reach 12-14 on land, and 15-17 in coastal areas, maritime areas, and highlands. This will be accompanied by widespread heavy rain to torrential rain across the city, with exceptionally heavy rain locally.

### II. Minimise Unnecessary Travel

During the impact of the typhoon, avoid going out unless absolutely necessary. If you are already outdoors, immediately seek shelter in a sturdy building. Keep clear of facilities easily toppled by strong winds, such as billboards, transmission towers, scaffolding, large trees, and utility poles. Local authorities may issue school and work suspension arrangements based on the impact of the typhoon. When a Typhoon Yellow Warning is issued, nurseries, kindergartens, primary, and secondary schools are required to suspend classes. Employers should arrange for staff to postpone work, leave early, or suspend work operations depending on the situation.

### III. Inspect and Secure Facilities

Check and reinforce doors, windows, sheds, temporary structures, and other installations susceptible to being moved by the wind. Apply tape in a crisscross

pattern on loose or cracked windows to reduce the risk of shattering. Maritime vessels should return to port to avoid the storm, secure mooring lines, and guard against dragging anchors and collisions. Move flower pots, miscellaneous items, external AC units, drying racks, awnings, and other easily dislodged items from balconies and windowsills indoors. Secure with ropes those items that cannot be moved indoors to prevent them from falling and causing injury.

## **IV. Prepare Emergency Supplies**

Prepare emergency supplies in advance, such as torches (flashlights), candles, power banks, drinking water, and food, in case of possible power or water outages. Residents in low-lying areas should also relocate valuables like appliances and furniture to higher ground beforehand. Use flood barriers and sandbags to block doorways and prevent water intrusion. Simultaneously, check household drainage pipes and clear debris from balcony and patio drains to ensure unobstructed water flow.

## **V. Traffic Safety**

If you are driving, immediately move your vehicle to an underground car park or a sheltered location. Do not attempt to drive forcefully. During rainy conditions, ensure you "maintain distance, reduce speed, and keep your lights on (including tail lights)". Avoid sudden braking or sharp turns to prevent wheel skidding. When driving through flooded areas, turn off the auto start-stop function, cautiously assess the water depth, and never attempt to drive through blindly. If your vehicle stalls in a flooded section, do not restart the engine; evacuate immediately and seek assistance from the police.

## **VI. Guard Against Secondary Disasters**

Residents in mountainous areas, near rivers, or in low-lying regions must be particularly vigilant against secondary disasters such as mountain torrents, mudslides, and waterlogging potentially triggered by heavy rainfall. Avoid taking shelter in low-lying areas prone to rapid flooding, such as underground garages, underground shopping centres, and culverts. Stay away from waterways, reservoirs, and canals. If you notice water levels rising rapidly, evacuate to higher ground immediately. Relevant departments will conduct inspections of potential mountain flood and geological hazard sites, small and medium-sized rivers, and urban waterlogging points. They will resolutely, proactively, decisively, and thoroughly organise the relocation of people from dangerous areas.

In facing the typhoon, please remain vigilant, prioritise personal safety as the utmost principle, and follow the guidance and arrangements of local government and emergency departments.
